CSV for File Extract Requests

Create a CSV File to extract files from a ZIP file

- The first row of the CSV file should have the following headers

  > FileName

- Subsequent rows will have the records of files to be searched.
- The search criteria have to be given as follows :
  - The values in each row have to match for the file to be selected.
  - Each row has only one value for the filename. So if you want to search for multiple files, then multiple rows, each having a different filename will have to be added to the CSV
